Introduction

UK⁽¹⁾ & EU⁽²⁾ agricultural polices & strategies shifting towards sustainable use of are & conservation of farmland resources Clearly, there is a need for biodiversity. balancing environmental management whilst maintaining crop yield & nutritional quality. Water soluble vitamins including B vitamins $(B_1 - thiamine, B_2 - riboflavin, B_3 - nicotinic)$ acid, B_5 - pantothenic acid, B_6 - pyridoxine), as well as vitamin C are one important aspect contributing to overall nutritional quality. Vitamins are a broad group of organic bioactive compounds that are minor, but nutritionally essential constituents of food. In 2009, The James Hutton Institute set up the Sustainable Cropping for (CSC) Centre Platform (http://csc.hutton.ac.uk/) as a longplatform experimental for term crossdisciplinary research on sustainability in agricultural ecosystems (Figure 1). The CSC is a 42 hectare contiguous block of six arable fields within the Balruddery Farm, Dundee, North-East Scotland. A method by Nurit et al.⁽³⁾ was adapted to quantify the levels of five water soluble B vitamins in a range of different crop matrices, including potato, field beans, Spring barley, Winter barley & Winter wheat, to explore whether our integrated management practices impact upon the water-soluble vitamins in these crops in a rotational system over five consecutive years.

Methods

Sample material from five crops including potato (*Solanum tuberosum* L.), field beans (*Vicia faba* L.), Spring & Winter barley (*Hordeum vulgare* L.) & Winter wheat (*Triticum aestivum* L.), each with select varieties (each with five replicates, respectively), grown over five consecutive years (2011-2015) under two different management practices were extracted for B vitamin analysis, following the protocol from Nurit *et al.*⁽³⁾. Chemical analysis of B vitamin content was performed on an Agilent 1260 HPLC system coupled to an Agilent 6460A Triple Quadrupole Mass Spectrometer (Agilent Technologies, Santa Clara, CA, USA). Vitamin C content of extracted potato samples was also determined on a High Performance Liquid Chromatography system coupled to a UV-Vis detector (HPLC, Dionex Ultimate 3000, Thermo Scientific). A separate statistical analysis was performed on \log_{10} transformed quantitative data for each crop using **Re**stricted <u>M</u>aximum Likelihood (REML) procedures in GenStat for Windows 17th edition.

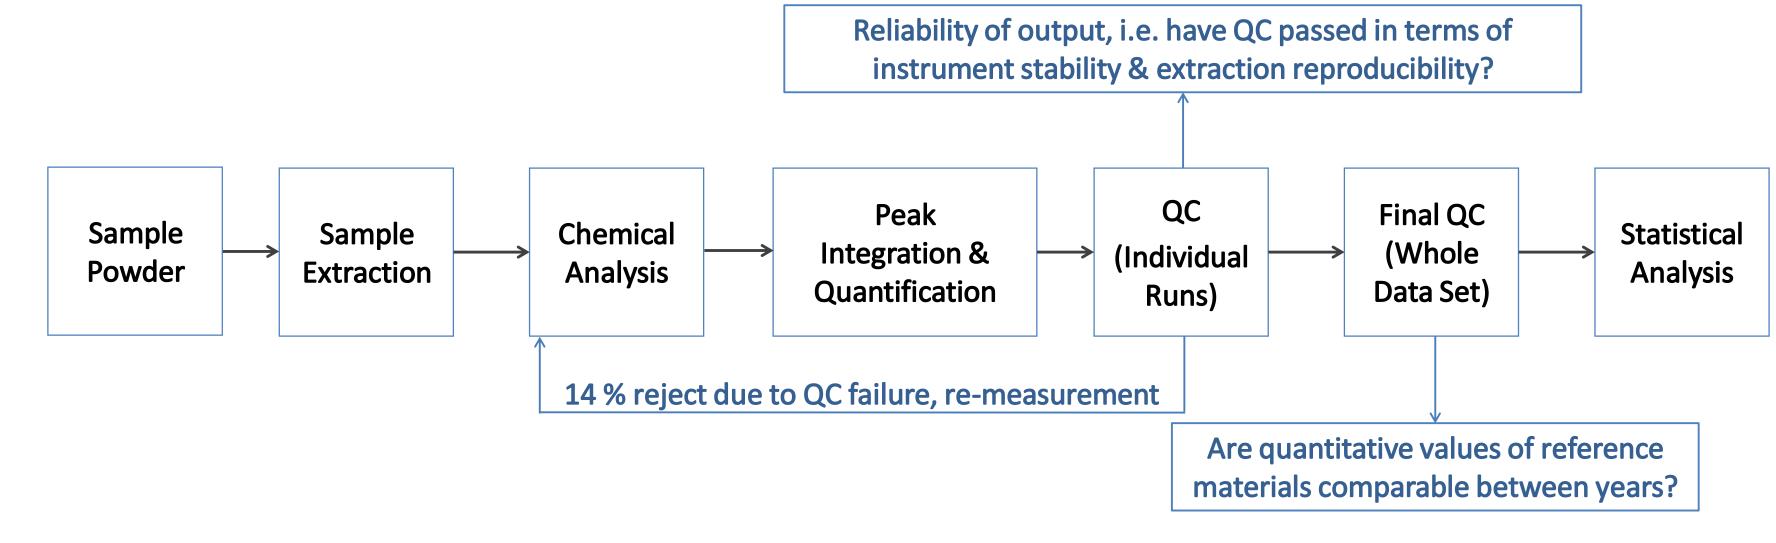

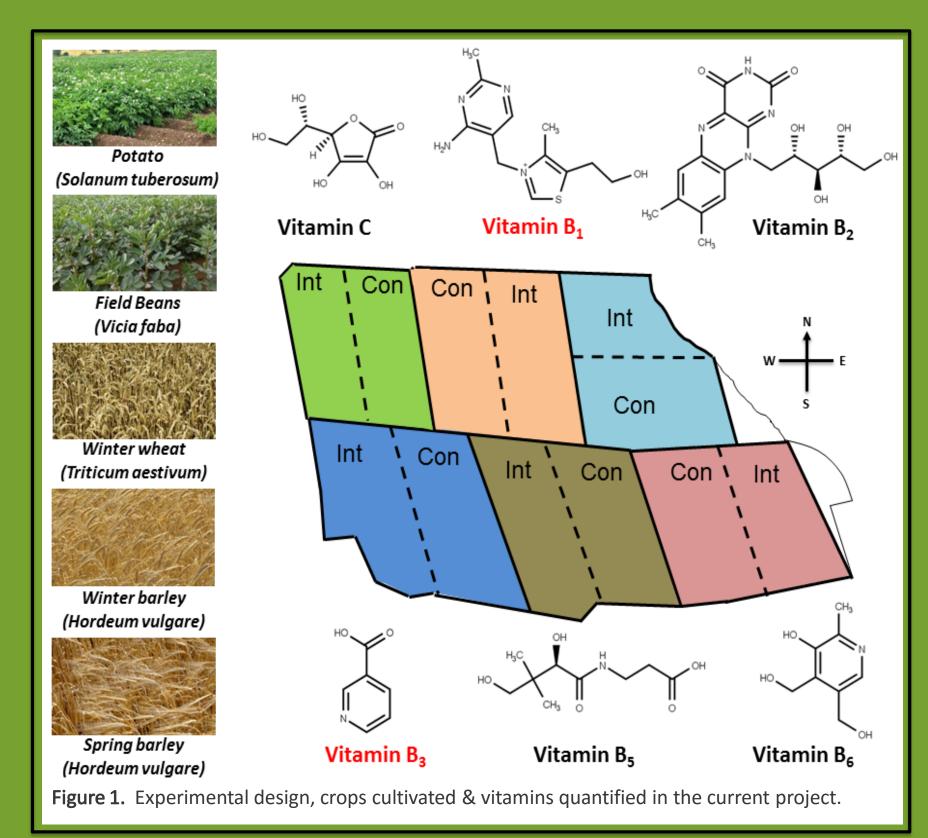

Figure 2. Schematic overview of experimental approach.

Results

 Potato had the highest concentration values in nicotinic acid, pantothenic acid, pyridoxine & riboflavin, followed by field beans (Figures 3A & 3B). Thiamine concentrations were in the same range.

Our integrated, when compared with the conventional, management practice only had minor effects on vitamin content, but significant effects were observed for thiamine in field beans (p < 0.01), Spring barley (p < 0.05) & Winter wheat (p < 0.05). Nicotinic acid was also significant in Winter wheat (p < 0.05).

 However, for all crops, Variety & Year differences were generally of greater significance (Table 1).

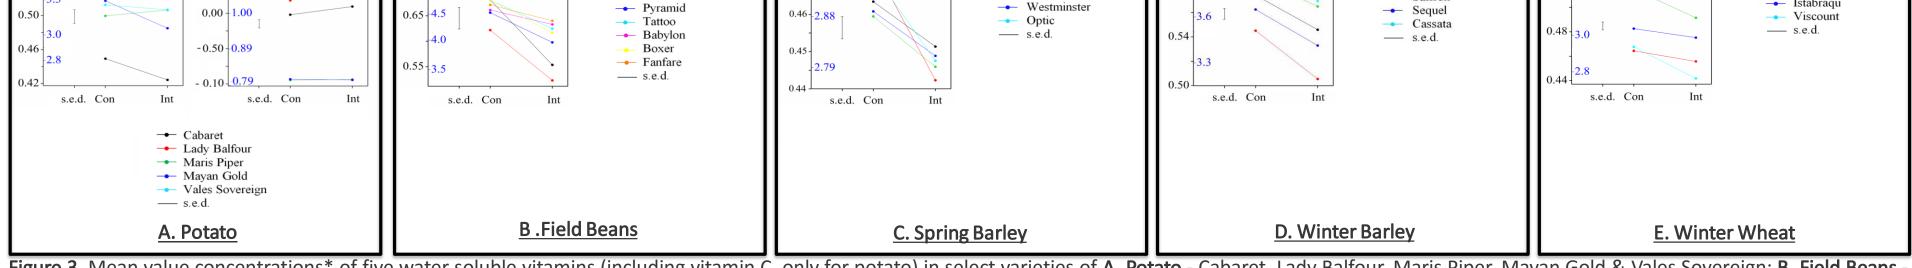

Figure 3. Mean value concentrations* of five water soluble vitamins (including vitamin C, only for potato) in select varieties of <u>A. Potato</u> - Cabaret, Lady Balfour, Maris Piper, Mayan Gold & Vales Sovereign; <u>B. Field Beans</u> - Ben, Fuego, Maris Bead, Pyramid, Tattoo, Babylon, Boxer & Fanfare; <u>C. Spring Barley</u> – 4-Comp Mix, Concerto, Waggon, Westminster & Optic; <u>D. Winter Barley</u> - 4-Comp Mix, Retriever, Saffron, Sequel, Cassata & <u>E. Winter</u> <u>Wheat</u> - Alchemy, Beluga, Consort, Istabraq & Viscount.

Where *= mean of five replicates per year x five years; 4-Comp Mix – 4-Component seed mixture; Con – Conventional; Int – Integrated.

Values are expressed on the logarithmically (log₁₀) transformed (black values), & as mg kg⁻¹ DW on the natural scale (blue values). The average standard of error of difference (s.e.d.) is for the Variety x Input term.

Conclusions

- Results obtained in this study indicate that Input, i.e. our integrated management system, does not
 affect nutritional value in terms of water soluble vitamin content.
- Variety & Year differences were of greater importance.
